ABSTRACT

Triazole and fused heterocyclic triazole derivatives like Schiff bases, thiadiazoles, thiadiazepine, thiadiazine etc. were synthesized and characterized by IR, MS and $^1$H NMR. The triazole derivatives were evaluated for their antibacterial activity against the gram-positive bacteria $B. megaterium$ and $S. aureus$, the gram-negative bacteria $E. aerogenes$ and $P. Aeruginosa$ using DMSO as a solvent.

INTRODUCTION

Heterocycles are in the center of research due to their versatile application. The triazole ring system is of particular interest especially within the realm of medicinal chemistry because of their versatile biological activity and clinical applications. A number of triazole derivatives are associated with good biological as well as pharmacological activities like antibacterial, anti-inflammatory, antihypertensive, antifungal, anticancer and antitumor activity. Fused heterocyclic triazoles also possess important clinical applications. In addition to these important biological applications, 1,2,4-triazoles are also of great utility in preparative organic chemistry as well as they have useful applications in agriculture and polymer industries. Research in the field of pharmaceutical has its most important task in the development of new better drugs and their successful introduction into clinical practice due to bacterial resistance over old drugs and other effects. Owing such properties by triazole derivatives lead us to synthesise new derivatives and evaluate their antibacterial properties.

MATERIALS AND METHODS

All melting points were recorded in open capillaries and on Veergo melting point apparatus. The $^1$H NMR spectra were recorded on a Bruker 300 MHz spectrometer at 300 MHz using TMS as an internal standard. The IR spectra were recorded on a Perkin Elmer Spectrum 100 FTIR spectrometer and the Mass spectra on a Waters Micromass Q-ft instrument. The chemicals used are of LR grade and were obtained from the local market.

Reaction scheme I

Reaction scheme II

Procedure for the synthesis of compound (I-VII)

Compound I : A mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol(0.01M) and p-methoxy benzaldehyde (0.01M) was taken in ethanol(25 ml) and 2-3 drops of acetic acid was added and the reaction mixture was refluxed for 10 hours. The product (I) was isolated and crystallized by absolute alcohol. The resulting product dried and weighed.

Compound II : To a mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol(0.01M) and P-toluic acid (0.01M) was added POCl$_3$ (25ml) and the reaction mixture was refluxed for 10 hours, poured on to crushed ice and the resulting solid was filter and washed with water. The resulting product (II) was crystallised from ethanol and then dried and weighed.

Compound III : To a mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol(0.01M) and P-anisaldehyde(0.01M) in 50 ml dimethylformamide, 50 mg p-toluene sulphonic acid (p-TsOH) was added and the reaction mixture was refluxed for 10 hours, poured on to crushed ice and the resulting solid was filtered and washed with water. The resulting product (III) was crystallised from ethanol and then dried and weighed.

Compound IV : A mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol(0.01M), 2-chloro-3-formyl-7-methoxy quinoline (0.01M) in dry DMF (20 ml) was added anhydrous K$_2$CO$_3$ (2.09 g) and refluxed at 80°C for 4 hrs. It was cooled and poured onto crushed ice and the resulting solid was filtered and washed with water. The resulting product (IV) was isolated and crystallised from ethanol and then dried and weighed.

Compound V : A mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol (0.01M), 2-chloro-3-formyl-7-methoxy quinoline (0.01M) in dry DMF (20 ml) was added anhydrous K$_2$CO$_3$ (2.09 g) and refluxed at 80°C for 4 hrs. It was cooled and poured onto crushed ice. The product (V) was isolated and crystallised from ethanol and then dried and weighed.

Compound VI : A mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol (0.01M), 2-chloro-3-formyl-7-methoxy quinoline (0.01M) in dry DMF (20 ml) was added anhydrous K$_2$CO$_3$ (2.09 g) and refluxed at 80°C for 4 hrs. It was cooled and poured onto crushed ice. The product (VI) was isolated and crystallised from ethanol and then dried and weighed.

Compound VII : A mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol (0.01M), 2-chloro-3-formyl-7-methoxy quinoline (0.01M) in dry DMF (20 ml) was added anhydrous K$_2$CO$_3$ (2.09 g) and refluxed at 80°C for 4 hrs. It was cooled and poured onto crushed ice. The product (VII) was isolated and crystallised from ethanol and then dried and weighed.
methanol (50 ml) was heated under reflux condition for 5 hrs, then cooled and neutralised with aqueous potassium carbonate solution. The product (V) was isolated and crystallized from ethanol and then dried and weighed.

Compound VI: A mixture of 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol (0.01M) and p-toluen sulfonyl chloride (0.01M) was refluxed in dry pyridine for 4-5 hrs. Product (VI) was isolated and crystallized from ethanol and then dried and weighed.

Compound VII: A mixture of p-methylbenzoylchloide (0.01 mol) and 4-amino-5-(6-methylpyridin-3-yl)-4H-1,2,4-triazole-3-thiol (0.01 mol) was refluxed in dry pyridine for 8 hrs. Product (VII) was isolated and crystallized from ethanol and then dried and weighed.

Preparation of Plates and Microbiological Assays

The in vitro antibacterial activity of the synthesized compounds was tested against some clinically important bacteria by the well diffusion method using Mueller-Hinton agar No.2 as the nutrient medium. Solutions of the synthesized compounds were prepared (10 mg ml⁻¹) in dimethylformamide. The bacterial strains were activated by inoculating a loop full of the test strain into 25 ml of nutrient broth and incubated for 24 hrs in an incubator at 37 °C. The inhibition zone, formed by the compounds against the particular bacterial strain with the solvent, where pure solvent was inoculated into the wells was measured to calculate the inhibition zone growth. The controls were maintained for each compound and the mean value obtained for three wells was used to conclude the inhibition zone growth. The controls were maintained for each bacterial strain with the solvent, where pure solvent was inoculated into the well. The inhibition zone, formed by the compounds against the particular bacterial strain was subtracted from the control, thereby determining the antibacterial activities of the triazole derivatives.

RESULTS AND DISCUSSION

Table 1 shows the molecular formula, molecular weight, melting point, percentage yield and R² value of all synthesised compounds. The Elemental analysis, IR, NMR and Mass spectral data are given below.

Characterization of Compound I-VII

Compound I: Elemental analysis : found (calcd): C, 58.97(59.06); H, 4.61 (4.65); N, 21.45 (21.52); IR (KBr, cm⁻¹): 3006 (Ar-C-H str.), 1606 (C=O str.), 1506 (C-C str.), 1029 (C-O-C str.), 690 (C-S str.), MS: 325[M⁺]; 1H NMR (ppm)(CDCl₃): 7.90-9.42 (7H, multiplet, Ar-H), 7.00-9.13 (7H, multiplet, Ar-H), 3.83 (3H, singlet, Ar-OCH₃), 2.65 (3H, singlet, Ar-CH₃).

Compound II: Elemental analysis : found (calcd): C, 62.42(62.52); H, 4.23 (4.26); N, 22.72 (22.78); IR (KBr, cm⁻¹): 3005 (Ar-C-H str.), 2849 (C-H str.), 1611 (C=O str.), 1485 (C-C str.), 1256 (C-S str.), 671 (C-S str.), MS: 307[M⁺]; 1H NMR (ppm)(CDCl₃): 7.03-9.13 (7H, multiplet, Ar-H), 2.68 (3H, singlet, Ar-CH₃), 2.35 (3H, singlet, Ar-CH₃).

Compound III: Elemental analysis : found (calcd): C, 59.34(59.43); H, 4.05 (4.05); N, 21.60 (21.66); IR (KBr, cm⁻¹): 3417 (OH str.), 3066 (Ar-C-H str.), 2983 (C=C str.), 1596 (C=C str.), 1355 (OH benz.), 1056 (N-N str.), 671 (C-S str.), MS: 323[M⁺]; 1H NMR (ppm)(CDCl₃): 9.48 (1H, singlet, -OH), 7.01-9.14 (7H, multiplet, Ar-H), 4.26 (2H, singlet, S-CH₂), 2.65 (3H, singlet, Ar-CH₃).

Compound IV: Elemental analysis : found (calcd): C, 49.76(49.84); H, 4.15 (4.18); N, 19.34 (19.38); IR (KBr, cm⁻¹): 3410 (N-H str.), 3068 (Ar-C-H str.), 2934 (C=C str.), 1588 (C=C str.), 1310 (SO₂, benz.), 1041 (N-N str.), MS: 361[M⁺]; 1H NMR (ppm)(CDCl₃): 14.00 (1H, singlet, -SH), 9.65 (1H, singlet, N-NH), 7.18-9.13 (7H, multiplet, Ar-H), 2.63 (3H, singlet, Ar-CH₃), 2.32 (3H, singlet, Ar-CH₃).

Compound V: Elemental analysis : found (calcd): C, 58.99(59.06); H, 4.61 (4.65); N, 21.47 (21.52); IR (KBr, cm⁻¹): 3220 (N-H str.), 1685 (Amide-C=O str.), 1605 (C=N str.), 1578 (N=O str.), 1020 (N-N str.), MS: 325[M⁺]; 1H NMR (ppm)(CDCl₃): 13.86 (1H, singlet, -SH), 9.72 (1H, singlet, N-NH), 7.16-9.13 (7H, multiplet, Ar-H), 2.65 (3H, singlet, Ar-CH₃), 2.33 (3H, singlet, Ar-CH₃).

Antibacterial Activity

The zones of inhibition of compounds are shown in Table 2. It can be concluded from the data that all compounds are moderately active against all tested bacterial strains. Compounds I and IV are the most active against B. megaterium, compounds VI and VII show the highest activity against S. aureus and P. aeruginosa and compounds IV and V are the most active against E. aerogenes.

CONCLUSION

Seven new triazole derivatives were synthesized. All of them showed moderate activity against all bacterial strains. Compounds I and IV were the most active against B. megaterium, while compounds VI and VII showed the highest activity against S. aureus and P. aeruginosa and compounds IV and V were the most active against E. aerogenes.

ACKNOWLEDGEMENT

Authors are thankful to head department of chemistry and biochemistry for providing necessary facilities.
